What should I look for when choosing a car lift?

Based on your interest in heavy-duty lifts with mobility features, here are the key factors to consider when choosing a car lift:

Weight Capacity & Vehicle Compatibility

- **7,000-12,000+ lbs capacity** for mid-size SUVs, trucks, and larger vehicles
- Consider your heaviest vehicle plus 20% safety margin
- **28"-39" maximum height** provides comfortable working access

Lift Type & Portability

- **Two-post lifts** offer excellent stability and clear floor access
- **Portable lifts with wheels** for flexibility in garage positioning
- **Scissor lifts** provide excellent stability for underbody work
- **Single-post mobile lifts** save 60% floor space but may have stability limitations

what's the difference with a single-post one

Great question! **Single-post lifts** are fundamentally different from the portable QuickJack and electric systems I mentioned earlier. Here's the breakdown:

Single-Post vs Two-Post Systems

Single-Post Lifts:

- **One central column** that lifts by one wheel or contact point
- **Saves 60% floor space** compared to two-post lifts
- **Mobile with wheels** - can be moved around easily
- **No power required** for some models (mechanical operation)
- **Lighter weight** - typically 120-1,600 lbs vs 2,500+ for two-post

Rufus ai
beta

However, for roadside assistance, single-post lifts have significant limitations:

- **Size & weight:** Even "portable" ones weigh 580-1,900 lbs
- **Setup complexity:** Require anchoring/stabilization for safety
- **Power needs:** Most need 220V (not available roadside)
- **Transport challenge:** Need truck/trailer to move
